

CRAZY ARCHITECTURAL SHAPES

The amazing properties of aluminium opens up the minds of architects to new shapes and new structures. Combining functionality with beauty, wild, curving shapes are becoming increasingly part of the man-made landscape.

Newport Station in South Wales is one of the most eye-catching structures in the UK railway system thanks to an aluminium roof that wraps itself round two platforms and the connecting footbridge.

Aluminium is not just important in the roof finish but also plays a key role in the building's structure.
