

SMALL PACKAGES

Especially at this time of year many chocolates lie temptingly in homes and workplaces. They are often wrapped in brightly coloured Aluminium foil.

The Aluminium foil wrappers keep the chocolates fresh and also provide protection from light and heat. In December 1907 Aluminium foil was first applied as a protective barrier for food products. By 1913 it was being used for wrapping chocolate and other confectionary.

As you pop the chocolate into your mouth don't forget that it was made possible by Aluminium, and don't forget to recycle the wrapper.
