

## HORSE DRAWN ALUMINIUM

The horse drawn carriage is designed for private passenger use and for comfort or elegance, though some are also used to transport goods. In most European and English-speaking countries, driving is a competitive equestrian sport. Modern high-technology carriages are made purely for competition. Internationally, there is intense competition in the all-round test of driving, also known as horse-driving trials.

The requirement for speed and agility means that these beautiful carriages feature Aluminium in all elements of the structure and wheels. The high-tech Aluminium wheels are designed to mimic the profile of traditional wooden ones.
