

IN MEMORY MATERIAL

One fateful night in May 1944, the Canadian Halifax bomber LW 682 was shot down over Belgium. The plane was recovered in 1997 and the aluminium from the aircraft has become part of a war memorial in London.

In early January 2012, Aluminium from the plane was melted into a sheet ingot and then turned into coated plates. These Aluminium plates have been used in the ceiling of the RAF Bomber Command Association Memorial Building honouring airmen who died during World War II. The memorial, in Green Park in London, was unveiled on June 28th 2012.
