

ALUMINIUM POINTS THE WAY

The history of modern road signs can be traced back to the development of the 'ordinary' bicycle during the 1880's. Since the 1960's the shape, content, and reflective properties of road signs have been strictly regulated across the developed world. Most signage is now manufactured using Aluminium for the sign and the bracing. In addition to durability the road signs need to strong and lightweight.

Changes in road layouts and regulations mean that there is a continuous supply of redundant signs which need to be recycled. The unique combination of properties and recyclability means that Aluminium is the ***'sign of the times'***.
